

Try one real workflow review

HCAI Engineering-Handoff Profile · 0.1-rc.4-candidate.2

The invitation

Would you try this guide with one real, bounded workflow you know? We want to learn whether the questions are understandable, the evidence is obtainable, and the result helps identify a useful next action. A stop is a useful result.

This is voluntary formative use-not an endorsement request, certification, or a controlled effectiveness study. Do not use it to authorize deployment or submit confidential client/customer information.

Bring and do

Bring one recent example of today's work and the proposed artifact. Choose a small workflow with a person who knows it. Agree what may be retained; private is the default.

Ask six questions: What happens today? What needs to improve, for whom? What happens on failure? What demonstrates the important behavior? What work remains for people? Is there enough evidence to fund a bounded engineering step?

Low risk with records available can use QUICK-6. Its ≤ 15 -minute target is untested and includes capture/explanation; record preparation separately. Higher/unknown risk or a failed gate moves to FULL. Stop when evidence is missing rather than creating plausible answers. You may stop participation at any time.

Please return only what you permit us to retain

- Date, role/sector, first use or repeat, profile/risk, and protocol/MCP/Skill versions.
- Preparation and session minutes; stopped gate or passed/failed/missing gates.
- Missing evidence, proposed next action/owner, and any revision triggered.
- Before/after decision if actually captured; no retrospective invention.
- In your own words, what does the result allow? What was confusing or hard to find? Was the next action clear?
- Anonymization and permission: private, anonymized publication, or expressly approved attribution.

The facilitator records artifact versions/digests without requiring publication of the artifacts. Do not send raw personal/customer data. Agree retention/deletion arrangements before sharing.

What happens afterward

A permitted run may inform another candidate revision. It does not by itself validate effectiveness or show that the tool prevents AI-coding defects. We will not publish your name or comments without the appropriate permission.
